The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contenins 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, musciles, skin tissue, bone marrow and retina The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits
                                                                                                                                                                                                                                                                                                                                                                     ö
                          The present invention relates to synthetic multiblock copolymers comprising linkers and peptide blocks derived from peptide sequences found in native silk biomacromolecules such as the crystalline domain of the spider, Nephila clavipes, or the silkworm, Bombyx mori. The synthetic multiblock copolymers are produced by replacing the amorphous peptide domain of a structural biopolymer such as silk with a nonpeptide segment while maintaining the beta-sheet forming crystalline segments. The
                                                                                                                                                            multiblock copolymers have solid-state structures and mechanical properties similar to the naturally occurring structural biopolymers. The copolymers are useful for producing films or fibres with high tensile strength. The present sequence represents a spider beta-sheet crystalline segment found in the silk biopolymer.
                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cell attachment; cell culture; transplantation; vaccine; antibiotic.
                                                                                                                                                                                                                                                                                                                                                                     ;

high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition useful for producing fibers or films, comprises hybrid multiblock copolymer derived from Nephila clavipes or Bombyx mori silks.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a novel composition (CI) comprising a hybrid multiblock copolymer. The multiblock copolymer comprise peptide linkers, which are derived from peptide sequences found in native silk biomacromolecules or the crystalline domains of Nephila clavipes or Bombyx mori silks. The present sequence is one such peptide linker. (Cl is useful for producing films or fibers utilized in tissue-engineering scaffolds, cell culture substrates, biocompatible coatings, sutures, membranes, grafts and drug delivery systems. (CI) enables to produce fibers or films having increased stiffness and tensile strength.
                                                                                            Gaps
                                                                                            .;

The invention relates to determining, monitoring and/or controlling the quality of a sample comprising at least one peptide and/or protein, comprising providing at least one protease-sensitive standard and/or at least one modification-sensitive standard and/or at least one modification-sensitive standard and/or at least one standard and/or protein, and determining the level of proteolytic cleavage and/or modification and/or peptide loss of the standard. The proteolytic cleavage is due to the presence of at least one protease selected from cleavage is due to the presence of at least one proteases selected from the proteases, oxperine proteases, metallo proteases, metallo proteases, metallo proteases, cycleans proteases, metallo proteases, complement cascade. The protease sinvolved in the clotting cascade and protease sansitive standard is at least one protease complement cascade. The protease sensitive standard is at least one protease complement cascade. The protease sensitive standard is at least one protease complement cascade. The protease sensitive standard is at least one protein, capacitic comprising at least one cleavage site for at least one protein, capacitic proteins and/or appetide loss of the standard with time. The present sequence is an Arg-C digest peptide from a hypothetical standard peptide (containing an Asp-N endoproteinase site and an Arg-C proteinase containing and trypsin) site) useful in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
This sequence represents a specific example of a polypeptide, which forms a beta sheet in an aqueous environment and has the general formula can beta sheet in an aqueous environment and has the general formula can Jahmixkuhmüün-NHiž, in which A = D- or L-alainine amino caid; ml.m2 = 0.40; ml.m2 = 10.40; J = a charged amino acid; n = 1 or 2; cx = any amino acid except proline; u = 0 or 1; J1 lyaine, hydroxylysine, carboxyglutamic acid; Ac = an acylation modification to the amino carboxyglutamic acid; Ac = an acylation modification to the carboxylic acid terminus; NH2 = an amidation modification to the carboxylic acid terminus; cramposition amidation modification to the carboxylic acid terminus; cramposition amidation acid; and XI = cysteine, threonine, tyrosine or serine. The peptides have thosphodiesterase activity and readily hydrolyse sugar phosphates. Further crampositions amine-catalysed decarboxylation (e.g. decarboxylation of they can cause amine-catalysed decarboxylation (e.g. decarboxylation of coxalacetate), and they can hydrolyse phospholipids. They can be used for screening drugs for the prevention or treatment of they can be used for screening drugs for the prevention or treatment of neurodegenerative diseases, e.g. Alzheimer's disease, which result in amiloid brotein deposition. They can also be used to screen for drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide(s) which form stable beta sheets in aq. environment - having phosphodiesterase and glycosidase activity and useful in bio:engineering.enzymatic and drug screening applications.
                                                 Beta sheet; circular dichroism spectroscopy; glycosidase activity; phosphodiesterase activity; drug screening; hydrolysis; neurodegenerative disease; Alzheimer's disease; amyloid deposition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 44; DB 2; Length 16;

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100$ with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                              cell attachment; cell culture; transplantation; vaccine; antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Beta sheet, circular dichroism spectroscopy, glycosidase activity, phosphodiesterase activity, drug screening, hydrolysis, neurodegenerative disease, Alzheimer's disease, amyloid deposition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       Silk; genetically modified; silk-like protein; polymer; silkworm fibroin; elastin; fibronectin; textile; food; industry; cosmetics; pET-SLP(n); pET-SLP(2; 4; 6); SLP6.
                                                                                                                                                         The invention relates to human orthologue of Aristaless homeobox gene, ARX. ARX gene is associated with infantile spasms (IS), non-specific X-linked mental retardation, X-linked myoclonic epilepsy and Partington syndrome. ARX gene is useful for diagnosing ARX-related disorders e.g., mild mental retardation, infantile spasms or dystonia. The present sequence is human ARX (GCG)10+7 mutant cDNA fragment encoded peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mass production of silk protein and silk-like protein having imparted function by employing genetically-modified Escherichia coli, useful in textiles, food industry and cosmetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for producing silk or genetically-modified silk-like protein, comprising designing a silk or silk-like polymer containing e.g. domesticated silkworm fibroin and synthesizing

the minimum unit of the silk or the thus designed polymer for integration into expression vectors and transfer into Escherichia coli prior to growing in a medium. Also disclosed is a method for producing silk or capencically-modified silk-like protein, comprising designing a silk or silk-like polymer containing at least one protein selected from constitution, wild silkworm fibroin, elastin and comesticated silkworm fibroin, wild silkworm fibroin, elastin and fibroin and essentially comprising the domesticated from cfibroin. The produced silk and silk-like protein are useful in textiles, food industry and cosmetics. Using this method, expression efficiency is greatly improved, thus providing silk-like protein with designed functionalities easily in large quantities. The SLP gene, PUC-link and SLP(n) were constructed for producing expression vector pEr-SLP(n) with expression of pET-SLP(2,4,6). The target protein SLP6 was obtained after cleavage of the tag sequence with use of cyanogens bromide. The sequences given in records for ADHS8932-ADHS8971 represent silk-like protein crelated polypeptides and polymucleotides, and primers used in the creation of the vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a method for mass production of silk protein and gene recombinant silk-like protein (SLP). The method involves integrating a silk like polymer selected from e.g. domestic silkworm fibroin, wild silkworm fibroin, elastin and fibronectin of the minimum unit into an expression vector selected from expression vectors containing Ty promoter. The method is useful for mass producing silk or silk-like proteins with improved cellular adhesiveness, elasticity or hardness and is also useful in clothing, food and cosmetic industries. The present sequence is a polyalanine peptide which is similar to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing silk or silk-like protein comprises integrating a silk like polymer comprising the minimum unit into an expression vector selected from expression vectors containing T7 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

ARX gene is associated with infantile spasms (IS), non-specific X-linked mental retardation, X-linked myoclonic epilepsy and Partington syndrome. ARX gene is useful for diagnosing ARX-related disorders e.g., mild mental retardation, infantile spasms or dystonia. The present sequence is human ARX 428-451dup(24bp) mutant cDNA fragment encoded
                                                                                                                                                                                                                                                                                                                                                            Homeobox gene; ARX; ARX-related disorder; X-linked myoclonic epilepsy; infantile spasm; mental retardation; Partington syndrome; diagnosis; dystonia; human; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human orthologue of Aristaless homeobox gene,
                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with creapect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various compenients, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, commones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The colypeptide exhibits extremely potent cells, more efficiently onto a base attach cells, such as NHDF and VBRO cells, more efficiently onto a base commentation methods. The polypeptide also exhibits conveniently. Thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related conveniently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQ 63.

                                                                                                                                                                                                                                    The invention relates to a novel polypeptide having cell adhesion property. The polypeptide comprises a minimum amino acid sequence and an auxiliary amino acid sequence capable of expressing a cell adhesion property and having a molecular weight of 1500-15000. The invention turther comprises a cell adhesion property polypeptide base material. The cell adhesion property polypeptide base material is useful for producing a cell. The cell adhesion property polypeptide is useful for culturing and analyzing cells, screening assays, and producing bloactive culturing and analyzing cells, screening assays, and producing bloactive substances such as cytokines, hormones, antibiotics, etc. The cell adhesion property polypeptide has excellent cell adhesion property, heat stability and has low immunogenicity. This sequence used in the cell adhesion property polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis A virus, HAV; immunogen; immunostimulant; virucide; vaccine; antigen; major structural capsid polypeptide; HAV antibody detection.
                                                                                                                                                                         polypeptide having cell adhesion property, useful for culturing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

molecules at the carboxy end of the peptide. The peptides are used to detect the presence of antibodies against HAV in mammalian serum, to detect the presence of HAV in a human or animal through the binding of the peptide to an antibody, to detect acute phase infection by detecting IgM antibodies in mammalian serum and detecting convalescence in ammunal. The peptides are used to detect or quantify HAV antibodies in samples in clinical or research-based assays using immunoblotting, fluorescence in situ hybridisation analysis, gel-mobility shift assays,
                                                                                                                                                                                                                                                                                                                                           tracking of radioactive or bioluminescent markers, chromatography or electrophoresis. The peptides are used to induce an immune response to HAV when administered to a human or animal. Glutamine at the carboxy end of the peptides enhances the IGM antibody reactivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lung cancer; tumour; cytostatic; immunostimulant; vaccine; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel compositions and methods for the therapy and diagnosis of cancer, particularly lung cancer. The compositions
                                                                                                      The present sequence is one of a number of synthetic peptides which are immunoreactive with hepatitis A virus (HAV) antibodies. The peptides comprise antigenic epitopes of the major structural capsid polypeptides or non-structural polypeptides of HAV with one or more glutamine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptides and encoding polynucleotides, useful for diagnosing, preventing and/or treating lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
Synthetic peptides used as antigen sources for enzyme immunoassays detecting anti-hepatitis A virus and as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

The invention relates to a method for producing silk or genetically-
modified silk-like protein, comprising designing a silk or silk-like
polymer containing e.g. domesticated silkworm fibroin and synthesizing
the minimum unit of the silk or the thus designed polymer for integration
into expression vectors and transfer into Escherichia coli prior to
growing in a medium. Also disclosed is a method for producing silk or
growing in a medium. Also disclosed is a method for producing silk or
growing in a medium. Also disclosed is a method for producing silk or
silk-like polymer containing at least one protein selected from
domesticated silkworm fibroin, wild silkworm fibroin, elastin and
fibronectin and essentially comprising the domesticated or wild silkworm
cibroin. The produced silk and silk-like protein are useful in textiles,
food industry and cosmetics. Using this method, expression efficiency is
greatly improved, thus providing silk-like protein with designed
functionalities easily in large quantities. The SLP gene, PUC-link and
                                                                                                                                                                                                                                                                                                                                          ö
comprise one or more lung turmour polypeptides, immunogenic portions therof, polymucleotides that encode such polypeptides, antigen presenting cells that express such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have cytostatic and immunostimulant activity. The lung turmour antigens can be used in the creation of a vaccine. The polymucleotides that encode the lung turmour polypeptides can be used in gene therapy to help in the treatment of lung turmours. This sequence represents a human lung turmour clone polypeptide of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property

SLP(n) were constructed for producing expression vector pET-SLP(n) with expression of pET-SLP(2,4,6). The target protein SLP6 was obtained after cleavage of the tag sequence with use of cyanogens bromide. The sequences given in records for ADH58932-ADH58971 represent silk-like protein related polypeptides and polynucleotides, and primers used in the creation of the vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vedvick TS;

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various caperinents, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NUPP and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits has tability, thus sterillamethods. The polypeptide also exhibits conveniently. The current sequence is that of a cell attachment-related
sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cytostatic applications and may be useful for detecting and treating lung cancer in a patient, as well as for inhibiting the development of lung cancer in a patient via incubating CD4+ and/or CD8+ cells isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (ApC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer-related peptide of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cell attachment; cell culture; transplantation; vaccine; antibiotic.

The method involves integrating a silk like polymer selected from e.g. domestic silkworm fibroin, wild silkworm fibroin, elastin and fibronectin of the minimum unit into an expression vector selected from expression vectors containing T7 promoter. The method is useful for mass producing silk or silk-like proteins with improved cellular adhesiveness, elasticity or hardness and is also useful in clothing, food and cosmetic industries. The present sequence is a silk-like protein with polyalanine (SLPA)
                                                                                   ö
                                                                                                                                                                                                                                                                                                   Domestic silkworm silk-like protein with polyalanine peptide SEQ ID: 24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing silk or silk-like protein comprises integrating a silk like polymer comprising the minimum unit into an expression vector selected from expression vectors containing T7 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

immunoreactive with hepatitis A virus (HAV) antibodies. The peptides comprise antigenic epitopes of the major structural capsid polypeptides or non-structural polypeptides of the major structural capsid polypeptides or non-structural polypeptides of HAV with one or more glutamine molecules at the carboxy end of the peptide. The peptides are used to detect the presence of antibodies against HAV in mammalian serum, to the peptide to an antibody, to a human or animal through the binding of the peptide to an antibody, to detect acute phase infection by detecting IgM antibodies in mammalian serum and detecting convalescence in a mammal. The peptides are used to detect or quantify HAV antibodies in samples in clinical or research-based assays using immunoblotting, fluorescence in situ hybridisation analysis, gel-mobility shift assays, tracking of radioactive or bioluminescent markers, chromatography or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HAV when administered to a human or animal. Glutamine at the carboxy end of the peptides enhances the IgM antibody reactivity
                                                                                                                                                                                                                                                                                                                                                                                                      synthetic peptides which are antibodies. The peptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes the production of a novel synthetic DNA (I), wells, encoding an antifreeze polypeptide, AFPWFBR modelled on the antifreeze peptide (AFP) found in winter flounder. The polypeptides encoded by (I) lower the freezing temperature of water and prevent ice formation, therefore are useful as antifreeze agents. The use of reminions produced synthetic peptides is less toxic than the use of chemicals (prior art). Naturally occurring antifreeze polypeptides are not available in large quantities, synthetic antifreeze polypeptides are more readily available. The antifreeze polypeptides are more readily available. Which is cheaper and less time consuming compared to direct chemical synthesis of synthetic peptides (prior art)
                                                                                                                                                                                                       Antifreeze peptide; AFP; wf8r; AFPWF8R; winter flounder; ice formation; water freezing temperature; antifreeze agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis A virus; HAV; immunogen; immunostimulant; virucide; vaccine; antigen; major structural capsid polypeptide; HAV antibody detection.

The invention relates to a miniblock polymer (I) comprising a self-
fabricating block and a solubilizing block, a block for triggering self-
can self-fabricate to form 3 - dimensional material and block for
incorporating turns in the polymer or for providing sites for chemical
modifications, has a molecular weight of 1000-300000 and, in solution,
can self-fabricate to form 3 - dimensional material and in solution,
controlled delivery of a drug which involves incorporating a drug
order, and where (I) has glycine content of at least 20%. (I) is useful
for controlled delivery of a drug which involves incorporating
the drug. The drug is incorporated within layers of the self-fabricating
material. (II) is useful for modifying the optical response of a device
in the near to mid infrared wavelength range which involves applying (II)
to the surface of the device (all claimed). (I) is useful for preparing
long range ordered fluids (i.e., liquid crystals) in a variety of phases
or forms, which can then undergo very specific structural transitions to
form rigid materials. (I) can be used as structural tissue implants, in
liquid crystal displays, and for producing high-performance composites.
(I) is useful for preparing chemically patterned templates with either
general features are specific features. (I) is also useful in
nanolithographic processes. A self-fabricated structure containing the
polymer (II) is useful for modifying and improving performance of IR-
sensitive devices, IR sensors, IR filters, inglet telescopes and
membranes or coatings that absorb specific perparing films,
membranes or coatings that absorb specific apple or parameters.
                                                                                                                                                                                      Miniblock polymer useful in nanolithographic processes, has self-fabricates fabricating block and solubilizing block, has glycine and self-fabricates to form 3-dimensional materials having long-range orders, in solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     miniblock polymer, optical response; mid infrared wavelength range; long range ordered fluid; liquid crystals; nanolithography; IR-sensitive device; IR sensor; IR filter; night telescope; thermosensitive detector; non-linear chromophore; biomacerial; tissue engineering scaffold; ferroelectric material; artificial muscle;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               radiation, and in optical applications e.g., as matrices to align non-
linear chromophores which are useful in creating materials for second
order non-linear orbits. (II) is useful in hydrogen catalysis, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               coatings for biomaterials, scaffolds for tissue engineering, ferroelectric materials, artificial muscles, switching devices, et sequence represents a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 44; DB 7; Length 21; Pred. The invention relates to a minibility block, a block for triggering self-
cabricating block and a solubilizing block, a block for triggering self-
fabrication by external or environmental conditions, and a block for
fabrication by external or environmental conditions, and a block for
incorporating turns in the polymer or for providing sites for chemical
can self-fabricate to form 3-dimensional material having long-range
can self-fabricate to form 3-dimensional material having long-range
corder, and where (1) has glycine content of at least 20%. (1) is useful
corder, and administering the self-fabricating material incorporating
corder, and administering the self-fabricating material incorporating
corder, and administering the self-fabricating acting
the drug. The drug is incorporated within layers of the self-fabricating
corder to mid infrared wavelength range which involves applying (1)
corder to mid infrared wavelength range which involves applying (1)
corder to mid infrared wavelength range which involves applying (1)
corder surface of the device (all claimed). (1) is useful for preparing
corder fluids (i.e., liquid crystals) in a variety of phases
corder form rigid materials. (1) can be used as structural transitions to
corder range ordered fluids (i.e., liquid crystal displays, and for producing high-performance compositions
corder range ordered fluids (i.e., liquid crystal transitions
corder range ordered fluids (i.e., liquid crystal transitions
corder range ordered fluids.
cordered fluids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   devices, etc. This
                                                                                                                                                                                                                                                                                                                                                                                                                                    Miniblock polymer useful in nanolithographic processes, has self-fabricates fabricating block and solubilizing block, has glycine and self-fabricates to form 3-dimensional materials having long-range orders, in solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     radiation, and in optical applications e.g., as matrices to align non-
linear chromophores which are useful in creating materials for second
order non-linear orbits. (II) is useful in hydrogen catelysis, as
coatings for biomaterials, scaffolds for tissue engineering,
ferroelectric materials, artificial muscles, switching devices, etc. The
sequence represents a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with caids and the sum total content of Gly and Ala in (Y) is 42-100% with crespect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The cylypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base catach relative to conventional methods. The polypeptide also exhibits conveniently. The current sequence is that of a cell attachment-related conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                        Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence, alternatively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell attachment; cell culture; transplantation; vaccine; antibiotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 44; DB 9; Length 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence, alternatively.

Disclosure; SEQ ID NO 56; 20pp; Japanese.

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell stateachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, 

hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention. 8888888888888

ö New isolated peptide and fusion peptide, useful for inserting proteins peptides and nucleic acids into the cell membrane in vivo or in vitro that may be useful in treating cancer or other proliferative disorders, e.g. psoriasis. 

Claim 5; Page 62; 111pp; English.

The invention relates to an isolated peptide used in compositions for expressing a composite receptor on the cell surface. The peptide is a fusion peptide comprising at least one cell penetrating domain which is linked to at least one transmembrane domain or to an adapter domain capable of binding to a molecule, where the orientation of the cell penetrating domain is independent of the orientation of the transmembrane or adapter domain. The peptides are useful for inserting proteins or peptides such as regulatory factors, enzymes, antibodies, drugs or toxins and nucleic acids such as DNA or RNA into the cell membrane either in vivo or in vitro, that may be useful in inhibiting or treating diseases or disorders, which could benefit from the addition of surface receptors to cells, such as cancer and other proliferative disorders like psoriaeis and cystic fibrosis. The methods are useful for identifying agents that modulate the activity of a receptor protein and for preparing the fusion

```
The invention relates to a miniblock polymer (I) comprising a self-
fabricating block and a solubilizing block, a block for triggering self-
c fabrication by external or environmental conditions, and a block for
incorporating turns in the polymer or for providing sites for chemical
modifications, has a molecular weight of 1000-300000 and, in solution,
c an self-fabricate to form 3 dimensional material having long-range
corder, and where (I) has glycine content of at least 20%. (I) is useful
for controlled delivery of a drug which involves incorporating
within (I), and administering the self-fabricating material incorporating
material. (II) is useful for modifying the optical response of a device
in the near to mid infrared wavelength range which involves applying (II)
to the surface of the device (all claimed). (I) is useful for preparing
to the surface of the device (all claimed). (I) is useful for preparing
to forms which can then whom where the surface of the control of the surface of the device (all claimed).
                                                                                                                         ö
peptide. This sequence represents a transmembrane domain of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Miniblock polymer useful in nanolithographic processes, has self-fabricates fabricating block and solubilizing block, has glycine and self-fabricates to form 3-dimensional materials having long-range orders, in solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or forms, which can then undergo very specific structural transitions to form rigid materials. (1) can be used as structural tissue implants, in liquid crystal displays, and for producing high-performance composites. (1) is useful for preparing chemically patterned templates with either general features are specific features. (1) is also useful in nanolithographic processes. A self-fabricated structure containing the

polymer (II) is useful for modifying and improving performance of IRsensitive devices, IR sensors, IR filters, night telescopes and thermosensitive detectors. (II) can be used for preparing films, membranes or coatings that absorb specific wavelengths of infrared radiation, and in optical applications e.g., as matrices to align nonlinear chromophores which are useful in creating materials for second order non-linear orbits. (II) is useful in hydrogen catalysis, as coatings for biomaterials, scaffolds for tissue engineering, ferroelectric materials, artificial muscles, switching devices, etc. The sequence represents a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                             Gaps

23-FEB-2006, entry version 15.
05JNBa0004G10.7 protein (Hypothetical protein B1008C01.41).
Name=CSINBa0004G10.7; Synonyms=B1008C01.41;
Oryza sativa (japonica cultivar-group).
BNkaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; BEP clade; Ehrhartoideae; Oryzeae; Oryza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MUCLEOTIDE SEQUENCE.

"Characterization of ribosomal phosphoprotein P0 of Eimeria tenella.";
Submitted (FBB-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Ribosomal protein P0 is the functional equivalent of
E.coli protein L10.
-!- SUBUNIT: P0 forms a pentameric complex by interaction with dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Galagan J.E., Calvo S.E., Cuomo C., Ma L.-J., Wortman J.R.,

"Foxd1-dependent signals control cellularity in the renal capsule, a structure required for normal renal development.";

Lovelopment 132:259-539(2005).

L. FUNCTION: Transcription factor required for formation of positional identity in the developing retina, regionalization of the pottic chiasm and morphogenesis of the kidney.

C. ISSUE SPECIFICITY: Predominantly expressed in the CNS and temporal half of the retina. Also expressed in the condensed head mesenchyme, metanephric blastema of the developing kidney, cortex of the adrenal gland, condensed mesenchyme at the base of the follicles of vibrassae and cartilage perichondrium of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     from the ventricular zone, expression declines markedly. By E16.5 levels are diminished and restricted to unfused pockets along the exhausted ventricular zone.
                                                                                                                                                                                                                                                                                                                                                                                   07-FEB-2006, entry version 39.
Forkhead box protein D1 (Forkhead-related protein FKHL8) (Forkhead-related transcription factor 4) (FREAC-4) (Brain factor-2) (HFH-BF-2) Name=Foxdl; Synonyms=FKHL8, Freac4, Hihbf2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         developing vertebrate.

Developing vertebrate.

Subvision of the neuroepithelium and also in the temporal half of the primary optic cup and the optic stalk. At Elo.5, seen in the hypothalamus, temporal half of the optic stalk, and temporal hemiretina. At Ell.5 and Ell.5 a high expression is seen in regions of condensed mesenchyme of the head, and as neuroepithelial cells begin to differentiate and migrate outward.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MISCELLANEOUS: Mice lacking Foxdl show disrupted cell identity in

Sasaki T., Matsumoto T., Yamamoto K.;
Submitted (FEB-2002) to the EMBL/Genbank/DDBJ databases.
-!- DOMAIN: The RING-type zinc finger domain is essential for ubiquitin ligase activity. It coordinates an additional third zinc ion (By similarity).
-!- SIMILARITY: Contains 1 RING-type zinc finger.
                                                                                                                                                                                                                                                 Transcription, Transcription regulation.
Porkhead box protein D1.
/FTIG=PRO_000091811.
Pork-head.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oryza sativa (japonica cultivar-group).
